Program Manager with nearly three years of program management across software delivery on a multi-tenant SaaS platform, supporting $20M+ in core product contract revenue. Keeps moving pieces on schedule across engineering, QA, product, and design, approves every production release, and raised engineering output by 25% by turning repeatable program work into durable mechanisms. Reviews AWS usage monthly, prioritized work that added an estimated 50% hosted data volume at no additional resource cost, and built a Request Intake Tool with Claude Code.

Core Competencies

- **Technical Program Management**: Cross-functional delivery, SDLC, release management, Agile/Scrum, delivery plans, and risk and dependency management (RAID).
- **Durable, Low-Toil Mechanisms**: Jira automations, a Request Intake Tool, program health dashboards, and a prioritization model that turn repeatable program work into standing processes.
- **AI Governance and AI Fluency**: AI Acceptable Use Policy, ISO 42001-aligned framework, AI tool inventory and risk review; Claude Code for a Request Intake Tool, specs, and Jira velocity reports; Cursor, ChatGPT.
- **Data and Insights**: On-time delivery, velocity, and contract realization tracking; dashboards in Power BI and Tableau; SQL.
- **Cloud and Infrastructure Exposure**: Monthly AWS usage bill review and optimization, including capacity growth at no additional resource cost; Amazon Web Services (AWS) fundamentals, security controls for cloud infrastructure, and vulnerability scanning in CI/CD.
- **Communication**: Status and asks for engineering partners, executive and stakeholder communication, and technical documentation in Jira and Confluence.

Professional Experience

- **EKN Engineering**
  Program Manager *Jul 2025 - Present*
  - Led program delivery across the full SDLC for over.vu, a multi-tenant SaaS platform serving utility clients, coordinating 10 engineers, 3 QA testers, 3 PMs, and 3 UI/UX designers from sprint planning through QA, release, and post-launch monitoring.
  - Rebuilt sprint rituals from scratch, implemented Jira automations, and aligned sprint goals to OKRs, increasing engineering output by 25% with full team adoption within days.
  - Acted as de facto release manager: enforced code review policy and SDLC compliance, approved every production release, and coordinated and triaged critical hotfixes.
  - Managed release coordination for three concurrent AI/ML initiatives: a computer vision model (95% accuracy, 20% reduction in inspection cycle time), an LLM-powered summarization feature, and an agentic recommendation engine.
  - Built an internal Request Intake Tool with Claude Code that scores and prioritizes requests automatically before they reach the backlog, surfacing ~$5M in previously unquantified business value for the 2026 product roadmap and driving org-wide adoption of a structured feedback and prioritization process.
  - Built the prioritization model, aligned teams on priorities, and make the final call when priorities are disputed.
  - Review the AWS usage bill monthly and coordinate with DevOps and the managed services vendor to optimize it.
  - Prompted and prioritized a technical refactor migrating from DocumentDB to PostgreSQL and did the cost optimization research with Engineering, who executed the work, enabling an estimated 50% increase in hosted data volume with no additional resource cost.
  - Led a mid-cycle pivot that identified critical platform gaps and saved a $1M contract at risk.
  - Used Claude Code to help write feature specs and to integrate with Jira to develop velocity reports.
  - Supported $20M+ in contract revenue from the core SaaS product and $5M+ from separate bespoke client software.

- **EKN Engineering**
  Program Coordinator *Jan 2024 - Jul 2025*
  - Oversaw the software team's delivery of an estimated 130+ features in a year across 4 concurrent product lines, with 100% on-time delivery.
  - Built program health dashboards that surfaced real-time delivery and compliance risk, enabling early intervention and accelerating contract deliverables by 1 month.
  - Served as the escalation point for product and engineering scope disputes, resolving them through accepted scope changes or sprint-slotted enhancements.
  - Coordinated concurrent product and engineering initiatives contributing to $3.6M in contract outcomes.
  - Became main point of contact for offshore vendors for tooling and AWS managed services, negotiating scope and contract, and continue in this role today.
  - Built the ISO 27001 and ISO 9001 programs from the ground up as lead and owner, and led both first certification audits.

AI Governance and Compliance

- Rolled out a company-wide AI Acceptable Use Policy and AI Management System framework aligned to ISO 42001, establishing the groundwork for future certification.
- As a key stakeholder on the AI Steering Committee, advise whether AI usage complies with ISO and SOC standards, client needs, and regulatory guidelines.
- Guided Engineering's safe adoption of AI development tools including Claude Code and Cursor, including configurations that meet client security requirements, and maintain the company's AI tool inventory.
- Led the company through its first SOC 2 Type I and Type II audits, establishing security controls for cloud infrastructure where none previously existed; passed both with minimal exceptions.
- Owned vendor and third-party risk management for all critical infrastructure providers, establishing a formal risk assessment methodology and recurring access reviews.
- Serve as compliance lead, leading all ISO and SOC 2 audits and making the call on whether projects with potential compliance issues proceed.
- Enabled the company to pass multiple client-led cybersecurity audits, enabling $5M-$15M in contract revenue.

Education

- **UC San Diego**
  Master's Degree in Public Policy *2023*
  Focus: Program Design & Evaluation.
- **UC San Diego**
  Bachelor's Degree in Environmental Systems *2021*
